Quantum Electron Microscope

Thomas Juffman, Christoph Kohstall, Brannon Klopfer, Gunnar Skulason, Joshua Francis, and Mark Kasevich

Physics Dept., Stanford University, Stanford, CA 94305

Recent advances in the quantum level control of electrons open the possibility of development electron microscopes based on non-destructive quantum measurement principles [1, 2]. Such instruments may enable real-time, non-destructive imaging of biological samples. This talk will describe our experimental effort to realize such a microscope based on ultra-fast laser triggered electron sources and electron resonators [3].
